Are the terms global warming and climate change interchangeable?
Do global warming and climate change mean the same thing? When should one term or the other be used?

[Stefanie Simpson](#)

I think the better term is climate change, since some places in the world receive colder temperatures. When people hear global warming and they have colder temp, it is a reason for them to discount that the process is actually happening, but climate change refers to all the impacts of pollution in our atmosphere.
